

DripGrip

inter-mold® hooks on 2 sides => 2 different heights of the system (H)

**inter-mold® hooks
attach to felt**

“DripGrip” support pipe

**Drainage layer is being
poured**

What You Need to Know...

- DripGrip holds green roof drip irrigation piping at the root level for efficient water delivery. It also prevents the drip line from migrating to the surface due to extremely light weight soils.
- DripGrip uses the patented APLIX inter-mold® technology that allows a hook and loop system to be integrally molded into the part, thereby eliminating the use of adhesives to attach the anchor to the roof.
- DripGrip works with any drip irrigation tubing (e.g. Toro, Rain Bird, Netafim).
- DripGrip can be configured to work with 4” and 6” media depths.
- DripGrip stabilizes the drip irrigation piping during the installation of growing medium.
- DripGrip is the only water and chemical resistant method for anchoring green roof drip irrigation piping.
